

Royal Train Shed in Wolverton (phase one completed)

Some views of the 1893 Royal Train Shed in Wolverton Park, north of London, after the zingonisation of the cast-iron upright beams and the roof-ties was completed.

The longitudinal steel beams supported by the cast-iron uprights hold the original overhead crane. The large Victorian cast-iron window frames were also blast-cleaned and zingonised. A few were cracked and had to first be repaired (welded) and zingonised

Above: The original overhead travelling crane was also zingonised in order to preserve to whole structure to Victorian standards

Above: The roof beams are all made from timber, and the steel tie-rods were zingonised.
A new roof is being made for the completed building
